

THE CARD SLOT

Abstract: An index card (10) holding device (12) to be attached to the surface of an object in a very convenient location which can be used to keep notes and record ideas when they are needed. The device allows the outer card being held to be in full view to the user. The outer end caps (18) are closely connected to the middle spacers (16) which are closely connected to the inner flat plate (14) in manner which creates a slot for holding 5 to 20 index cards (10) while allowing the cards to be removed and replaced easily. The thickness of the cards (10) being held creates the holding pressure against the inner flat plate piece (14) and the outer end caps (18). The shape of the middle spacers (16) prevents the cards from sliding out the back of the device. The present invention is attached to a surface by means of pressure sensitive adhesive.
